

1. Wired Ethernet/USB between PC/NW master

→ network route where NW master acts as router letting PC route packets all the way to sensor nodes & back

→ VLC on PC is "talking" to sensor nodes directly

→ will require some setup when connecting ~~the~~ NW master to PC

2. Firewall rule on NW master

→ forward RTP traffic to sensor node & back

instead of routing, bookkeeping

3. SSH to forward UDP?

→ maybe the easiest option, but not for PC.
